Summary	night. As we were coming in to Merimbula, we could see a layer of Overcast cloud ahea of us, and listening to the Merimbula AWIS, said it was at 2400ft, so we descended and got beneath it. Once we were beneath it, I noticed it was a fair bit darker, and visibility had reduced a bit, AWIS still said visibility was 10km. As we got abeam Merimbula for downwind join runway 21, we could tell the weather was getting worse, but we were sti well above minima, and the AWIS indicated light winds (around 6 knots). At this point, nothing was too alarming, everything was going normally. I came over the threshold of the runway and at about 10ft, we hit what I presume was some serious wind shear, the plane just dropped to the ground, and since we hit it pretty fast, we had a big bounce. After this first bounce, it was quite hard to recover the aircraft in to stability, and it continued to bounce around 6-7 more times on the runway. One of these bounces was be enough that the end of the propeller struck the ground (although I never heard anythin to indicate the prop struck, I knew it was a hard landing but I didn't hear any unusual sounds). Once we shut down the plane I inspected it and saw the damage, and the
